ABSTRACT:

The present invention relates to a herbicidal composition comprising

A) one or more compounds of the formula (I) 1

where V is an unsubstituted or substituted heterocyclyl radical or a radical --
CR.sup..alpha..dbd.CR.sup..beta.R.sup..beta.1, where R.sup..alpha. and R.sup..beta.
are identical or different carbon-containing C.sub.1-C.sub.40 radicals which
together can form an unsubstituted or substituted ring, and R.sup..beta.1 is OH or
a carbon-containing C.sub.1-C.sub.40 radical, and Z is an unsubstituted or
substituted aryl radical, and

B) one or more surfactants comprising, as structural element, at least 10, alkylene oxide units.

Summary of Invention Paragraph:

[0003] It is furthermore known from various publications that herbicides from the series of the benzoylcyclohexanediones, being inhibitors of para-hydroxyphenyl-pyruvate dioxygenase, are based on the same mechanism of action as those from the series of the benzoylisoxazoles; in this context cf. J. Pesticide Sci. 21, 473-478 (1996); Weed Science 45, 601-609 (1997), Pesticide Science 50, 83-84, (1997) and Pesticide Outlook, 29-32, (December 1996). Moreover, it is known from Pesticide Science 50, 83-84, (1997) that, under certain conditions, benzoylisoxazoles can undergo rearrangements to give benzoyl-3-oxopropionitriles.

Summary of Invention Paragraph:

[0190] h) compounds of the 5,5-diphenyl-2-isoxazoline-3-carboxylic acid type, preferably ethyl 5,5-diphenyl-2-isoxazoline-3-carboxylate (isoxadifen-ethyl, C3-1);

(2. 2,aRS,1'S(-)N-(1'-methyl-2'-methoxyethyl)-N-chloroacetyl-2-ethyl-6-methylaniline) and b) to antagonise the herbicide, an antidotally effective amount of a safener of formula 3.1 ##STR53##

Detailed Description Text (45):

b) to antagonise the herbicide, an antidotally effective amount of a safener selected from the compound of formula 3.1 ##STR54##

Detailed Description Text (56):

The invention additionally relates to a process for the selective control of weeds in crops of cultivated plants, which comprises treating said cultivated plants, the seeds or seedlings or the crop area thereof with a herbicidally effective amount of the herbicide of formula I, if required, one or more herbicides selected from the compounds of formulae 201 to 2.33 and, to antagonise the herbicide, an antidotally effective amount of a safener of formula 3.1 to 3.11.

Detailed Description Text (59):

Crop plants which may be protected. against the harmful action of the above-mentioned herbicides by the safeners of formulae 3.1 to 3.11 are in particular cereals, cotton, soya, sugar beet, sugar cane, plantations, rape, maize and rice, especially maize. Crops will also be understood as meaning those crops that have been made tolerant to herbicides or classes of herbicides by conventional breeding or genetic engineering methods.

Detailed Description Text (62):

Depending on the end use, a safener of formula 3.1 to 3.11 can be used for pretreating seeds of the crop plants (dressing of seeds or seedlings) or it can be incorporated in the soil before or after sowing. It can, however, also be applied by itself alone or together with the herbicide postemergence. Treatment of the plant or the seeds with the safener can therefore in principle be carried out irrespective of the time of application of the herbicide. Treatment can, however, also be carried out by simultaneous application of the herbicide and safener (e.g. as tank mixture). The concentration of safener with respect to the herbicide will depend substantially on the mode of application. Where a field treatment is carried out either by using a tank mixture with a combination of safener and herbicide or by separate application of safener and herbicide, the ratio of herbicide to safener will usually be from 100:1 to 1:10, preferably 20:1 to 1:1. In field treatment it is usual to apply 0.001 to 1.0 kg/ha, preferably 0.001 to 0.25 kg/ha, of safener.

Detailed Description Text (65):

For seed dressing, 0.001 to 10 g of safener/kg of seeds, preferably 0.05 to 2 g of safener/kg of seeds, is usually applied. If the safener is used in liquid form shortly before sowing to effect soaking, then it is preferred to use safener solutions that contain the active ingredient in a concentration of 1 to 10000 ppm, preferably of 100 to 1000 ppm.

Detailed Description Text (66):

For application, it is preferred to process the safeners of formula 3.1 to 3.11, or mixtures of these safeners with the herbicide of formula I and optionally with one or more herbicides selected from formulae 2.1 to 2.33, conveniently together with the customary assistants of formulation technology to formulations, typically to emulsifiable concentrates, coatable pastes, directly sprayable or dilutable solutions, dilute emulsions, wettable powders, soluble powders, dusts, granulates or microcapsules.

Detailed Description Text (70):

The compositions may also contain further ingredients, such as stabilisers, e.g. where appropriate epoxidised vegetable oils (epoxidised coconut oil, rapeseed oil, or soybean oil), antifoams, typically silicone oil, preservatives, viscosity regulators, binders, tackifiers, as well as fertilisers or other chemical agents. Different methods and techniques may suitably be used for applying the safeners of formula 3.1 to 3.11 or compositions containing them to protect cultivated plants from the harmful effects of herbicides of formula I and 2.1 to 2.33, for example the following:

Detailed Description Text (72):

a) Dressing the seeds with a wettable powder formulation of the active ingredient of formulae 3.1 to 3.11 by shaking in a vessel until the safener is uniformly distributed on the surface of the seeds (dry treatment). In this instance, approximately 1 to 500 g of active ingredient of formula 3.1 to 3.11 (4 g to 2 kg of wettable powder) is used per 100 kg of seeds.

Detailed Description Text (75):

In keeping with the natural environment, the preferred method of application is either seed dressing or treatment of the germinated seedlings, because the safener treatment is fully concentrated on the target crop. Usually 1 to 1000 g, preferably 5 to 250 g, of safener is used per 100 kg of seeds. However, depending on the method employed, which also permits the use of other chemical agents or micronutrients, the concentrations may deviate above or below the indicated limit values (repeat dressing).

Detailed Description Text (77):

A liquid formulation of a mixture of safener and herbicide (reciprocal ratio from 10:1 to 1:100) is used, the concentration of herbicide being from 0.005 to 5.0 kg/ha. This tank mixture is applied before or after sowing.

Detailed Description Text (103):

Formulation Examples for Mixtures of Herbicides of Formula I, Formulae 2.1 to 2.33 and Safeners of Formulae 3.1 to 3.11 (%=Percent by Weight)

Detailed Description Text (113):

The ability of the safeners of formulae 3.1 to 3.11 to protect crops from the phytotoxic action of herbicides of formula I will be demonstrated in the examples which follow.

Detailed Description Text (114):

Biological Example: Safening Effect

Detailed Description Text (115):

The test plants are grown under greenhouse conditions in plastic pots until reaching the 4 leaf stage. At this stage, the herbicides are applied to the test plants both on their own and in mixtures with the test substances that are to be tested as safeners. Application is effected in the form of an aqueous suspension of the test substances, prepared from a 25% wettable powder [example F3, b)] at 500 l water/ha. 3 weeks after application, the phytotoxic effect of the herbicides on the cultivated plants, such as maize and cereals, is evaluated on a percentage scale. 100% indicates that the test plant has perished, 0% indicates no phytotoxic effect.
